Received 11 November 2007; accepted 21 December 2007

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$; R factor = 0.062; wR factor = 0.157; data-to-parameter ratio = 14.6.

The Ni^{II} atom in the title complex, aquabis(2-formyl-6-methoxyphenolato- κ^2O,O')nickel(II), $[\text{Ni}(\text{C}_8\text{H}_7\text{O}_3)_2(\text{H}_2\text{O})]$, is five-coordinated by four O atoms from two *o*-vanillinate ligands and one water molecule in a slightly distorted square-pyramidal geometry ($\tau = 0.06$). In the crystal structure, the molecules are linked into dimers by intermolecular $\text{O}-\text{H}\cdots\text{O}$ hydrogen bonds.

Aquabis(*o*-vanillinato- κ^2O,O')nickel(II)

Q. Wang and D.-Q. Wang

Comment

The structural and magnetic properties of binuclear and polymetallic nickel(II) complexes with various bridging ligands have received considerable attention in the past three decades (Meyer *et al.*, 1982; Soules *et al.*, 1988; Edwards *et al.*, 1992; Asokan *et al.*, 1998). In this paper, we report here the synthesis and crystal structure of the title complex, a new nickel complex.

The molecular structure of the title complex, (I), is shown in Fig. 1. The Ni^{II} atom is five-coordinated in which four oxygen O(1), O(2), O(4), O(5) atoms from two *o*-vanillin ligands and one water molecule in a slightly distorted square pyramidal geometry, the tau value is 0.06 (Addison *et al.*, 1984). Ni(1), O(1), C(1), C(2), C(3), O(2) and Ni(1), O(4), C(9), C(10), C(11), O(5) form two six-membered chelating rings, which are essentially coplanar with a dihedral angle of 6.7 (0.19)^o.

As seen in Fig. 2, the molecules are linked into dimers by intermolecular O—H···O hydrogen bonds (Table 1).

Experimental

Amounts of 304.3 mg (2 mmol) of *o*-vanillin and 80.00 mg (2 mmol) of NaOH were stirred into 30 ml absolute ethanol under room temperature for 20 minutes, nickel chloride hexahydrate in the amount of 237.7 mg (1 mmol) was added, and the mixture was heated with stirring for 7 h and then filtered. The well shaped green polyhedral crystals of [Ni(C₈H₇O₃)₂H₂O] for structure determination and characterization were separated from the mother liquor by slow evaporation at room temperature after two weeks.

Refinement

All H-atoms were positioned geometrically and refined using a riding model, with C—H (methyl) 0.96, C—H (aromatic) 0.93, C—H 0.93 Å (methylene), O—H 0.85 Å (water), with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Figures

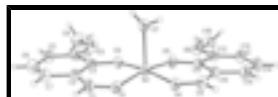

Fig. 1. The structure of the title complex, showing 30% probability displacement ellipsoids and the atom-numbering scheme.

supplementary materials

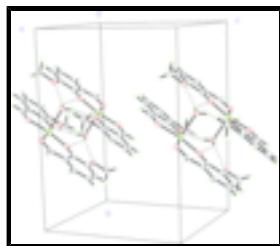

Fig. 2. The crystal packing of the title compound, viewed approximately along the bc plane.

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.062$	H-atom parameters constrained
$wR(F^2) = 0.157$	$w = 1/[\sigma^2(F_o^2) + (0.0683P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.00$	$(\Delta/\sigma)_{\max} < 0.001$
2909 reflections	$\Delta\rho_{\max} = 0.54 \text{ e \AA}^{-3}$

199 parameters $\Delta\rho_{\min} = -1.08 \text{ e } \text{\AA}^{-3}$
 3 restraints Extinction correction: none
 Primary atom site location: structure-invariant direct
 methods

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
